

SOMETHING'S MISSING  
IN MICROSOFT DYNAMICS CRM

## Maximize the value of your business data

Collect, transform and integrate your business data with ImportManager 2008.

ImportManager 2008 is a new and powerful tool by CRM Extensions that allows for large scale management of data for Microsoft Dynamics CRM, with unprecedented control and monitoring during the import, updating and deletion of data.

Besides allowing you to manage sophisticated data import tasks in Microsoft Dynamics CRM, ImportManager 2008 can help you with your complex data matching needs without requiring any SQL knowledge. ImportManager 2008 also allows easy drag and drop mapping of fields as well as the possibility of transforming your data on the fly with the help of the new dynamic field functionality.

ImportManager 2008's new client-server architecture enables one installation to connect to several CRM Servers. This enables you to log into the ImportManager 2008 Server from a client and control the import process according to each user's privileges.

Another feature of ImportManager 2008 is the new scheduling engine that runs tasks automatically on a regular basis; which is an ideal solution for larger imports. The new scheduling engine ensures that your CRM database is always updated with the latest information from all external data sources.

ImportManager 2008 can connect to Excel, Access, SQL, various ERP Systems, Text Files, other CRM Systems and any ODBC based systems through its intuitive Office 2007 like user interface.

To download a fully functional trial version of ImportManager 2008, please visit our homepage at [www.crmextensions.com](http://www.crmextensions.com). For more information, contact CRM Extensions: [sales@crmextensions.com](mailto:sales@crmextensions.com).
